

## Appendix A (Installing Oracle 11g Express Edition)

---

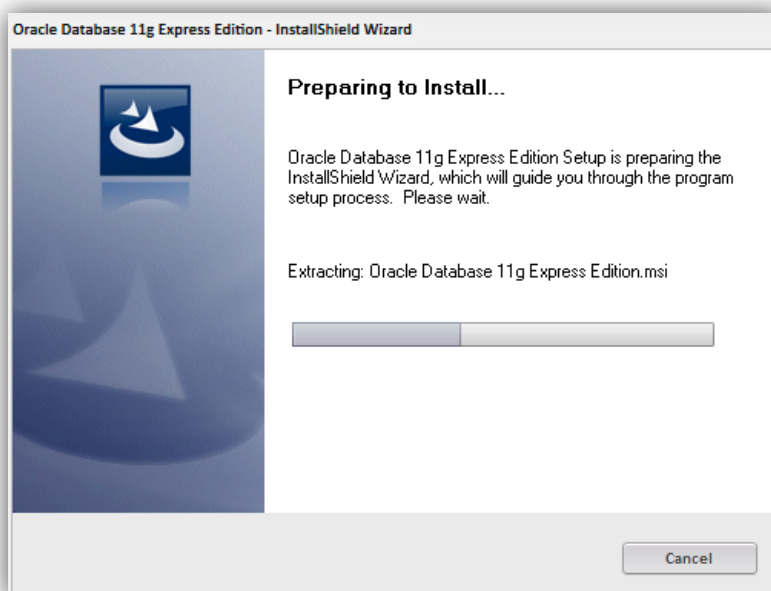

Well.. today we'll see how to go about installing the Oracle DBMS package on your system ☺ ....for our demo we'll use the latest version 11g (same procedure can be applied for older versions 10g,9i etc ) ... Also the Express edition is free to use & easy to manage ☺

Lets begin .... Whether you download from Oracle's site or borrow the setup from someone u'll end up with a folder with these contents ...

Name	Date modified	Type	Size
response	8/14/2011 4:05 PM	File folder	
upgrade	8/14/2011 4:05 PM	File folder	
setup.exe	4/5/2011 11:15 AM	Application	278,527 KB

Link to Download : [www.tinyurl.com/oraclesetupmvit](http://www.tinyurl.com/oraclesetupmvit)

Double click the setup.exe file ... & you'll be greeted by Oracle's setup preparation screen ...

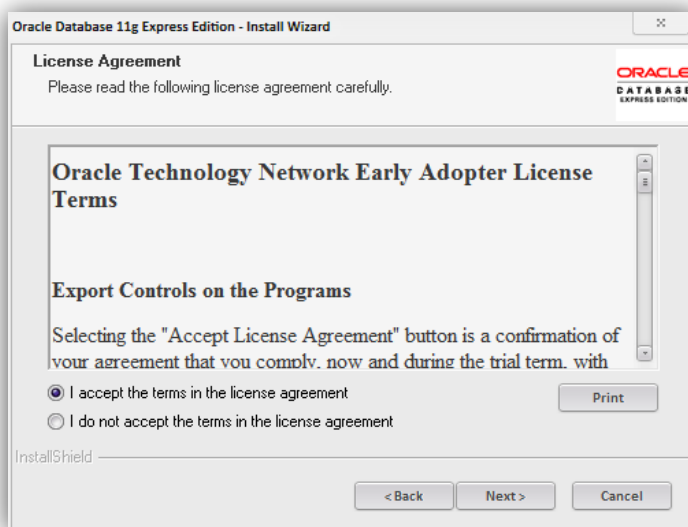

*When done ...you'll get the setup screen ...*

*click "Next" ...*

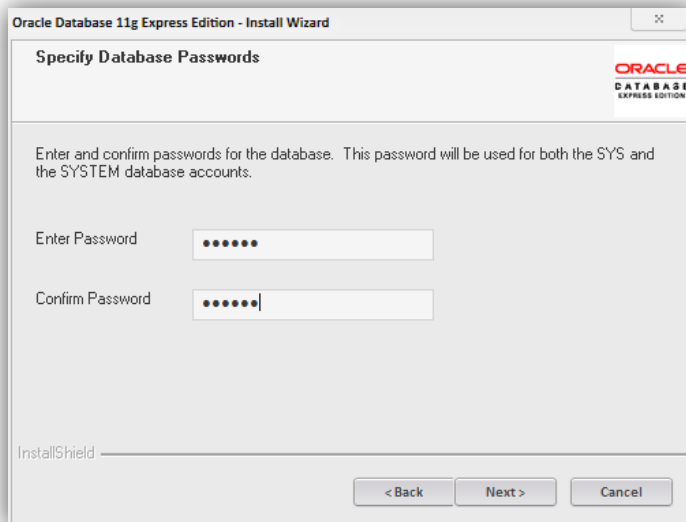

*The next screen is about the "End User License" accept and click "Next" ...*

*Select where to install & proceed...*

*Very crucial step ! ... make note of the password you enter here ... it's the SYSTEM(super god) password ... this will be used in future for all setup & maintenance purposes !!!*

*Make note of these important settings !!! ... click "install" ...almost done ☺....*

*The installation starts ... Well ... this takes a long time about 10-15 min ... I decided to go out n grab a bun samosa ... ;)*

*Your precious Database is being configured now 😊*

*You are done ... click finish 😊*

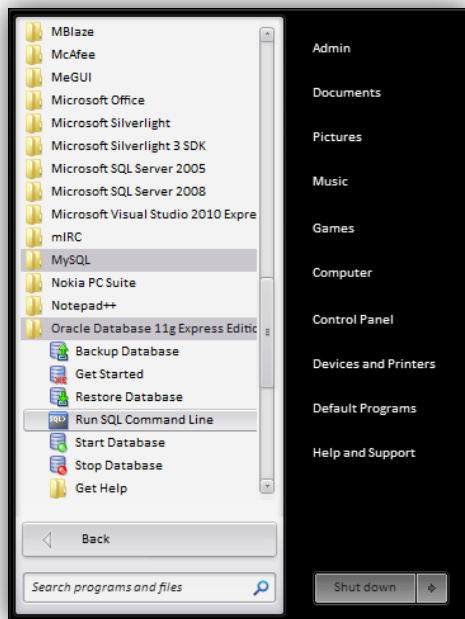

## Setting up SQL\*Plus Command Line

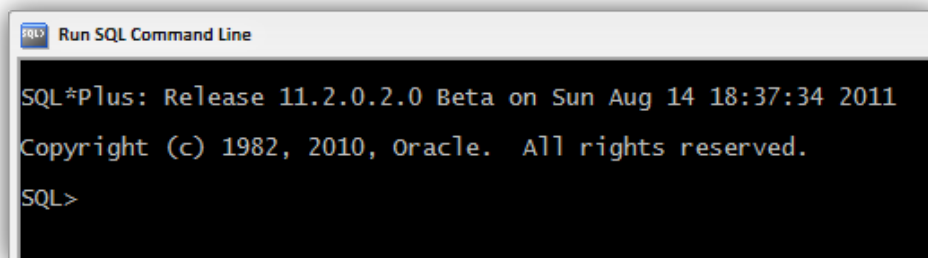

---

Start SQL\*Plus Command line by going to :

Start > All Programs > Oracle 11g Express Edition > Run SQL Command Line

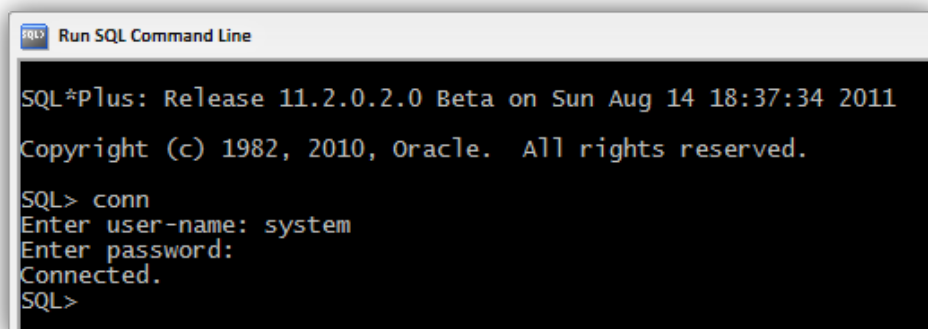

You'll then be greeted by the nice SQL Prompt ☺

You can Connect to the database using the SYSTEM Account u made earlier (remember the super powerful one) ... (Use the "conn" command to connect ) ...

Username : system

Password : the password u had given :P ... (ya the password is invisible while typing ...lol)

*Even though u can work now ...but ... its HIGLY recommended to create a basic(less powerful) user for day to day purposes because if u screw up something then u can always use the SYSTEM account to fix it ...*

*If u screw up while being in the system account its difficult to fix it(as ther's nothing higher than the SYSTEM acc to whom u can go asking for help) ... lol ...*

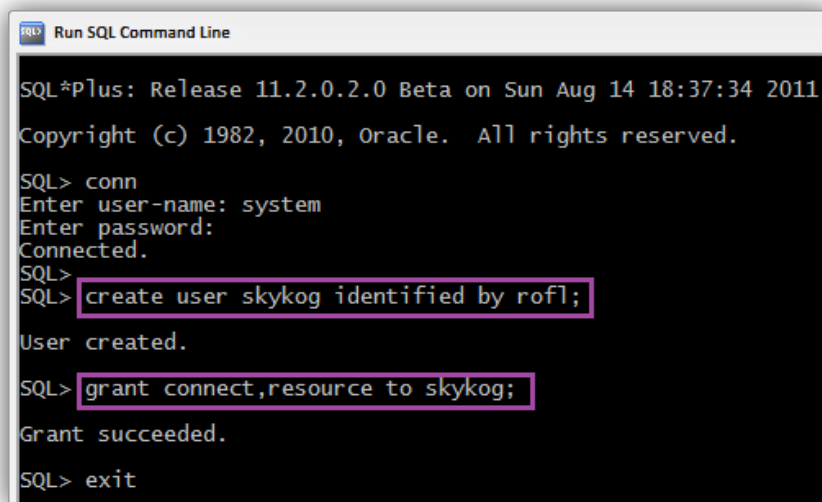

*In short the basic acc shoul be used for all general purpose day-to-day database work & the SYSTEM acc for high level DBMS maintenance ☺...*

*Login to to the SYSTEM account and enter the following commands to create a new basic user ..*

*I have used the following :*

*Username : skykog*

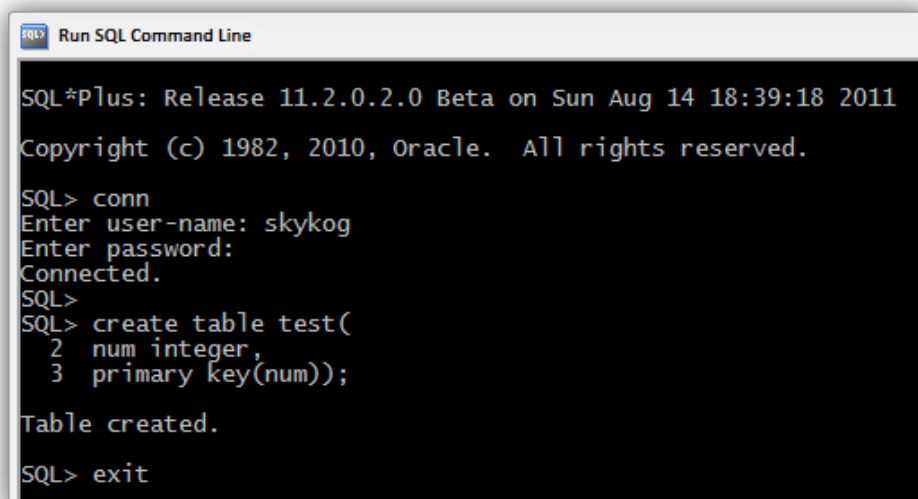

*Password : rofl*

```
SQL*Plus: Release 11.2.0.2.0 Beta on Sun Aug 14 18:37:34 2011
Copyright (c) 1982, 2010, Oracle. All rights reserved.

SQL> conn
Enter user-name: system
Enter password:
Connected.
SQL>
SQL> create user skykog identified by rofl;
User created.
SQL> grant connect,resource to skykog;
Grant succeeded.
SQL> exit
```

*Once Done you can now open this basic account & take it for a test drive ...*

```
SQL*Plus: Release 11.2.0.2.0 Beta on Sun Aug 14 18:39:18 2011
Copyright (c) 1982, 2010, Oracle. All rights reserved.

SQL> conn
Enter user-name: skykog
Enter password:
Connected.
SQL>
SQL> create table test(
  2  num integer,
  3  primary key(num));
Table created.
SQL> exit
```

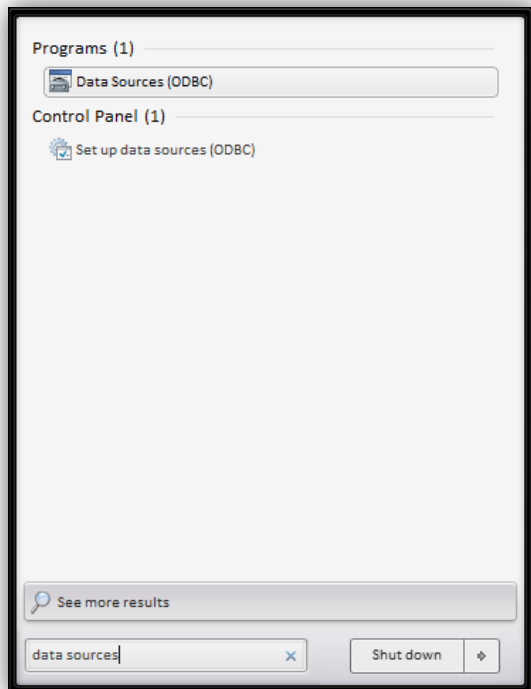

*Use only this account for day to day work ☺... Have fun ☺... Happy DBMSing ☺...*

## Setting up a Data Source (Optional)

If u want to be able to use your Oracle database through other programs like Visual basic, C#, ASP.Net then you need to do this one time procedure of setting up a Data source ☺...

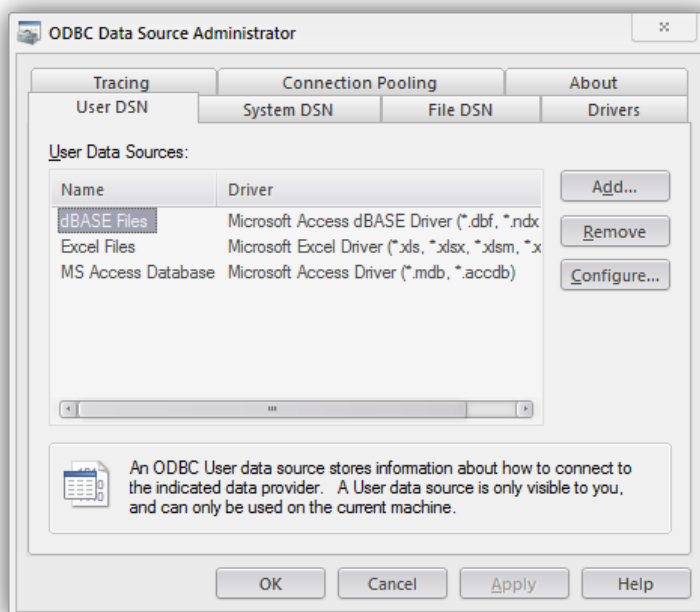

Basically the ODBC is a driver which acts as a middleman passing signals to & from your Oracle database & other the programs trying to access your database ...

Go to start > in Search Box type "Data Sources" ... select "Data Sources (ODBC)" ...

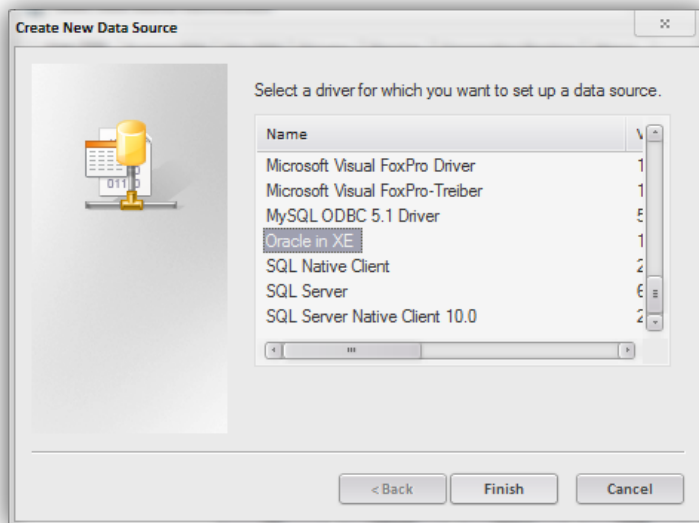

On Windows XP .. Start > Control Panel > Administrative Tools > Data Sources(ODBC) ...

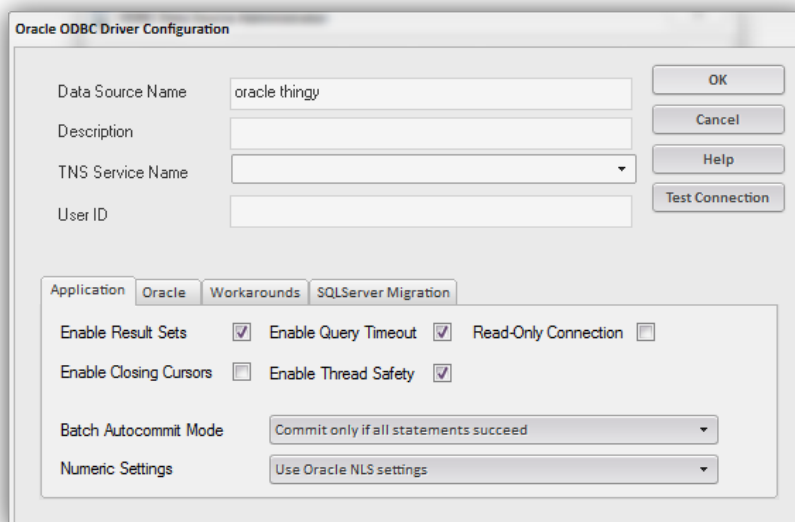

This is how the Data Sources Dialog Box looks like ...click "Add" ...

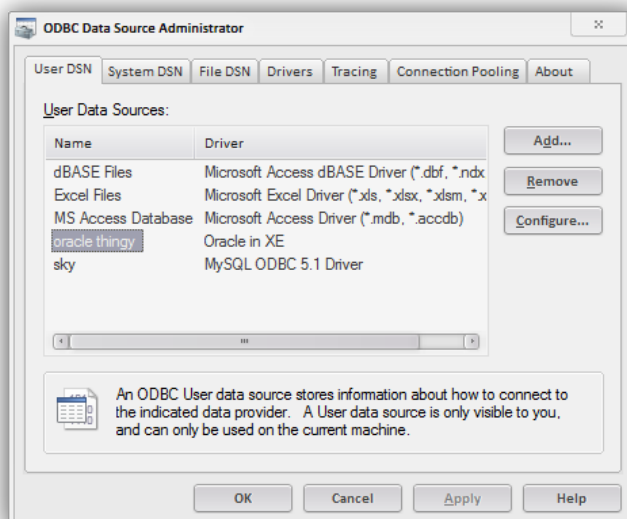

Select "Oracle in XE" somewhere down below ... click "Finish"...

Put any name u like in the "Data Source Name" & click "Ok" .. I chose "oracle thingy"...

Now it has been added in the list of available Data Sources... now you can use this data source to access your Oracle Database from other Applications ☺...

Done ☺ ....
